2 Summary Statistics

2.1 Fraction of Individuals with Pathogenic Non-Reference Sites

3 Penetrance Estimates

3.1 Max/Min Penetrance as a Function of $P(D)$ and $P(V|D)$

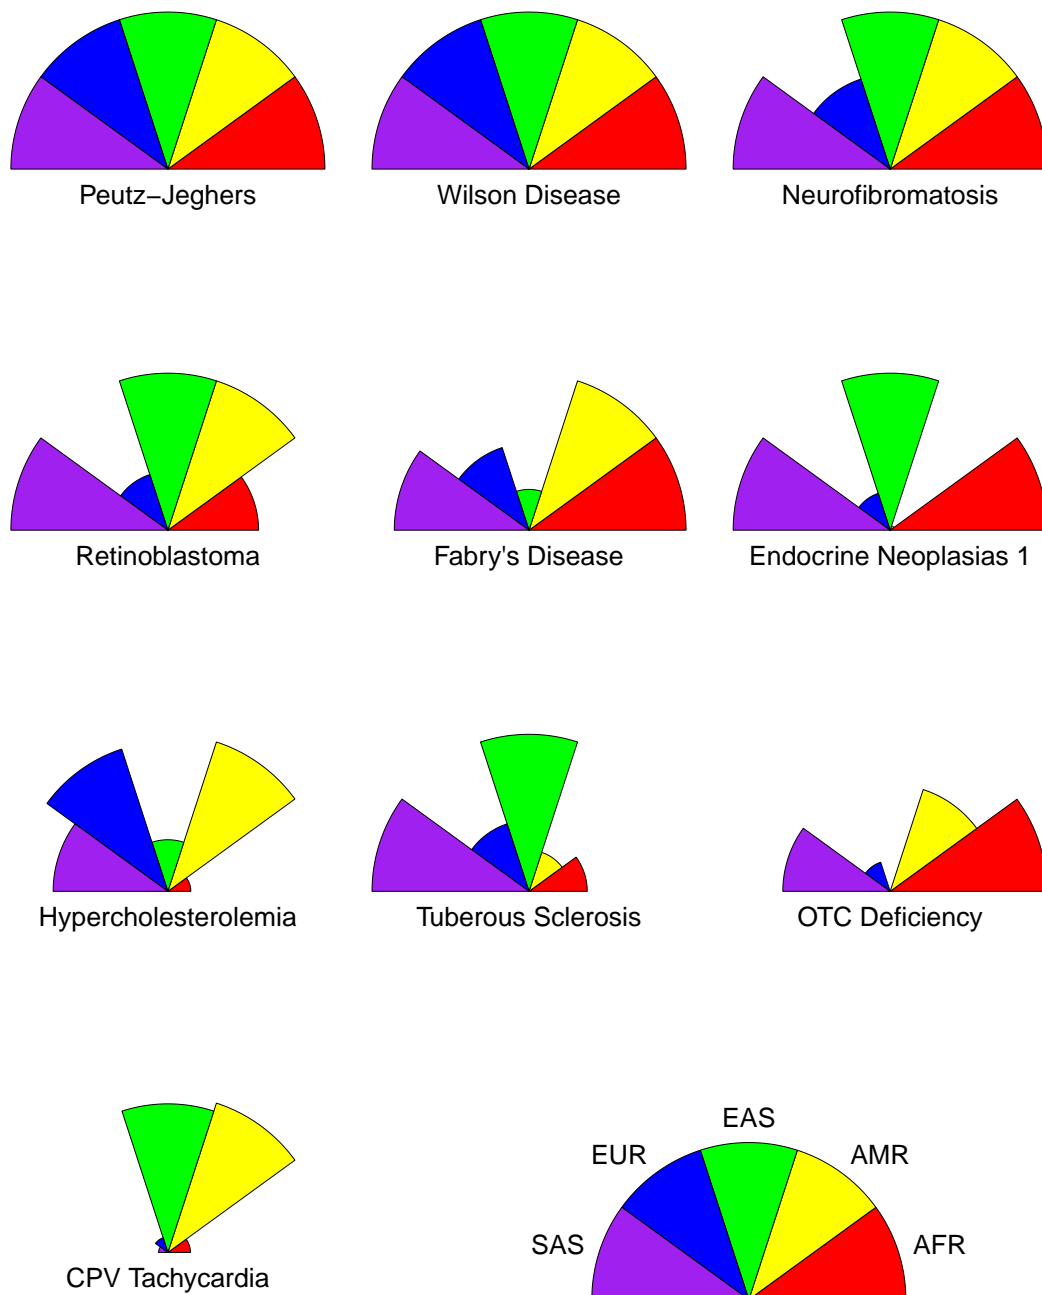

The left end of the boxplot indicates $P(V|D) = 0.01$,
the bold line in the middle indicates $P(V|D) = \text{point value}$,
the right end of the boxplot indicates $P(V|D) = 1$.

Note: Some diseases have mean theoretical penetrance = 1 because the assumed allelic heterogeneity is greater than is possible, given the observed prevalence and allele frequencies.

3.2 Penetrance Estimates by Ancestry

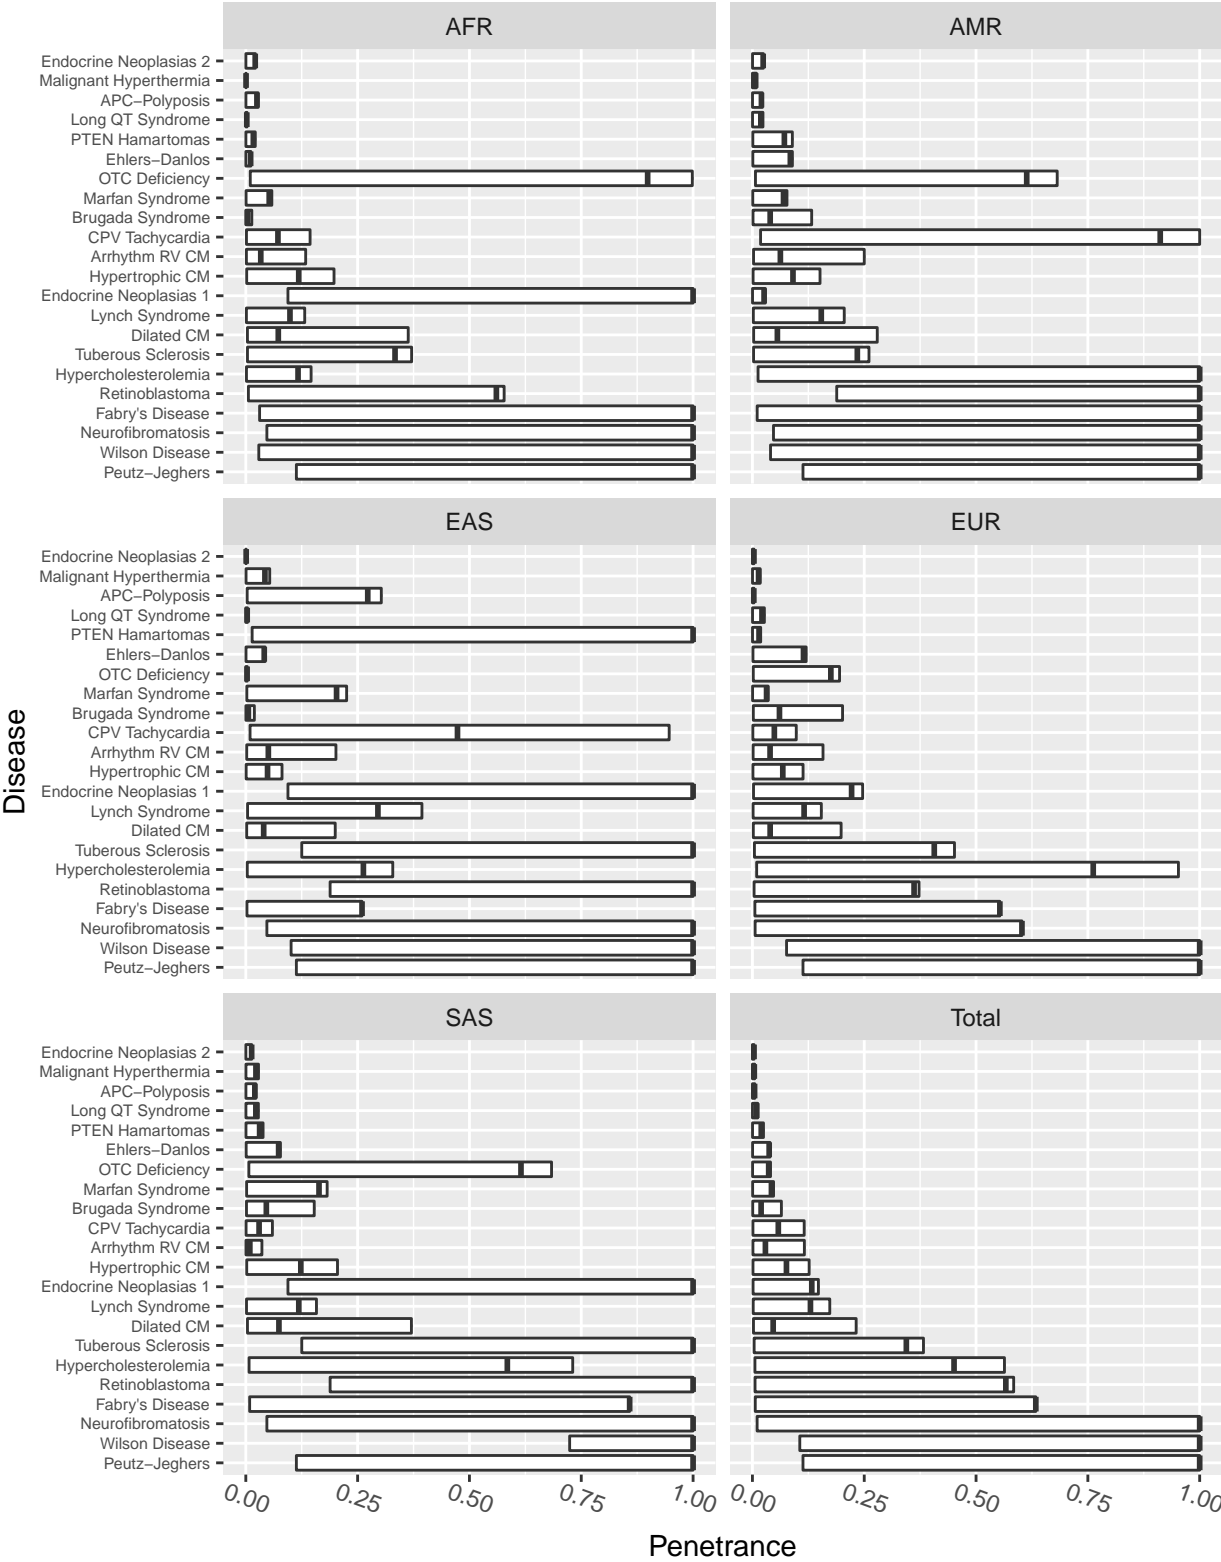

Radar Plot: Max Penetrance by Ancestry (gnomAD)

[1] These are the top 10 diseases by summed allele frequencies. NULL values are not plotted.

[1] Each radius is proportional to the penetrance of the disease in the given population.

Barplot: Penetrance by Ancestry (gnomAD)

Heatmap: Max Penetrance by Ancestry (gnomAD)

Dark gray boxes are NA: no associated variants discovered in that ancestral population.
