3 Penetrance Estimates

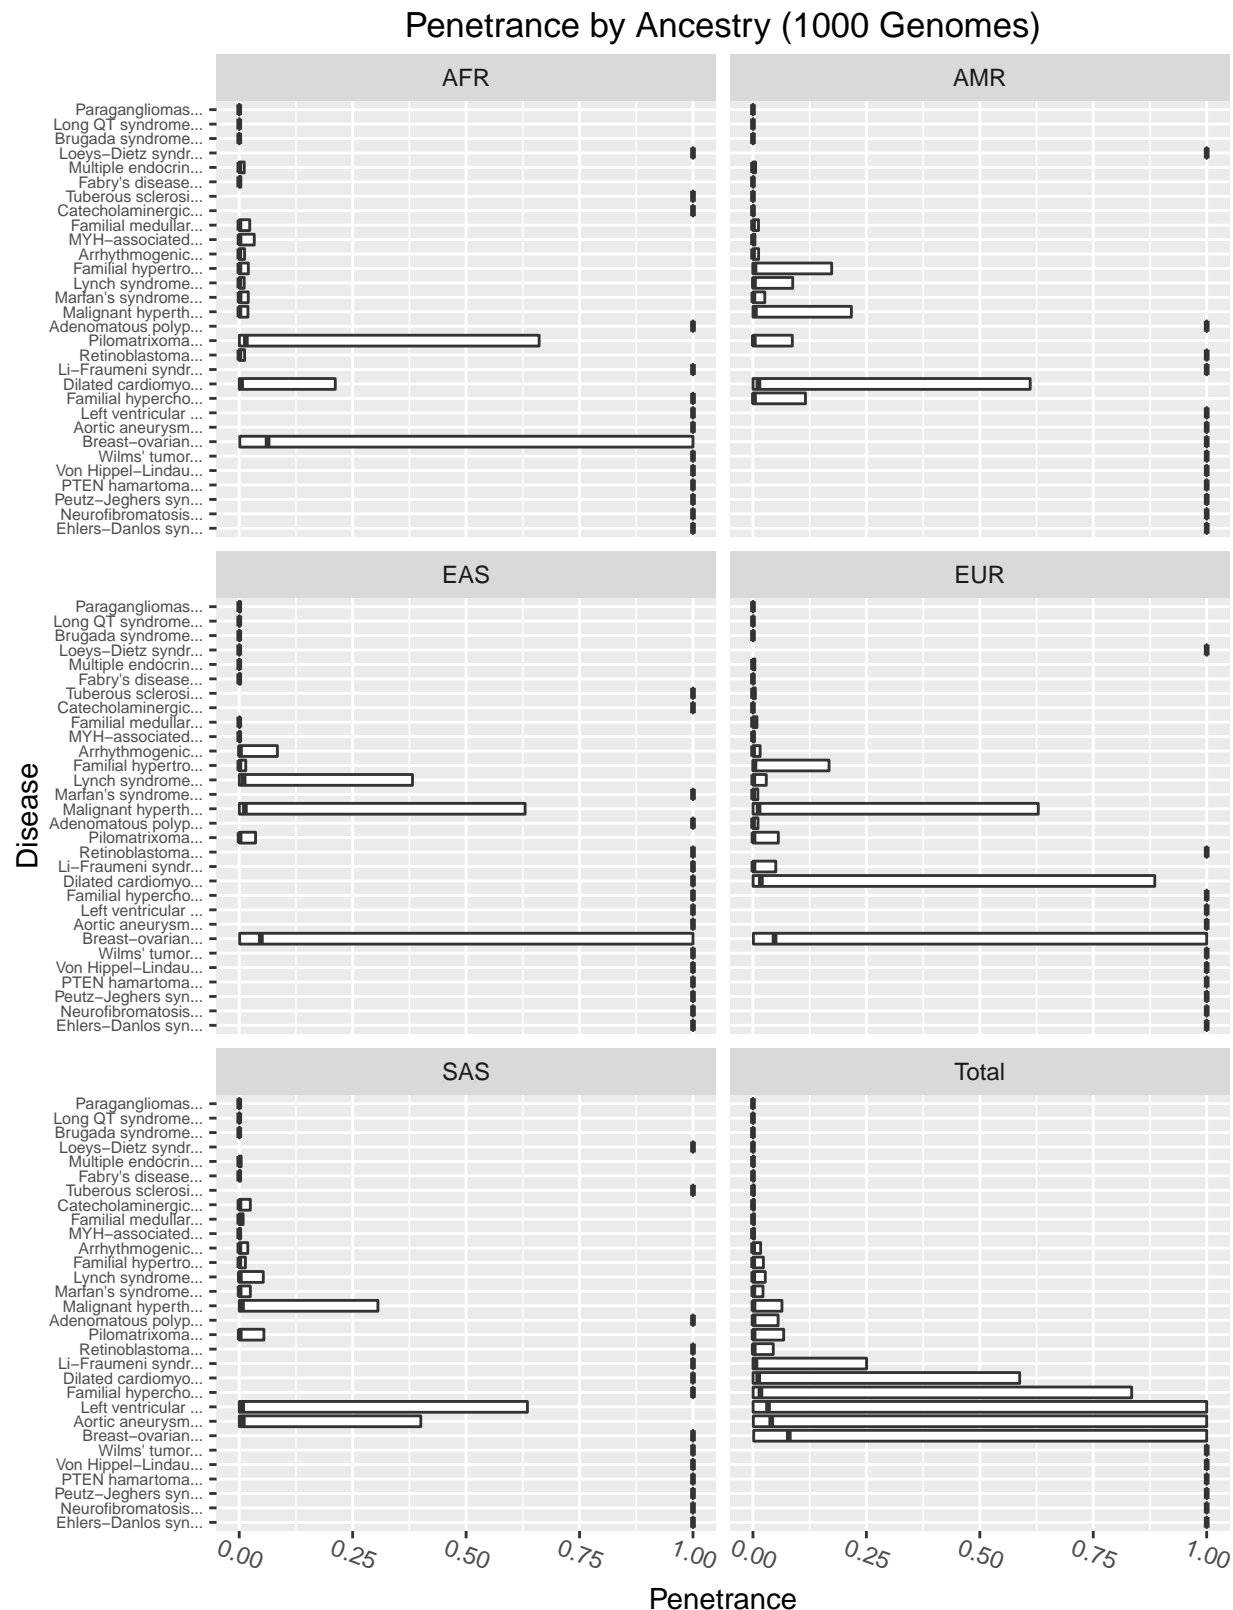

3.1 Max/Min Penetrance as a Function of $P(D)$ and $P(V|D)$

The left end of the boxplot indicates $P(D)$ AND $P(V|D)$ = lower value,
the bold line in the middle indicates $P(D)$ AND $P(V|D)$ = geometric_mean(values),
the right end of the boxplot indicates $P(D)$ AND $P(V|D)$ = upper value.

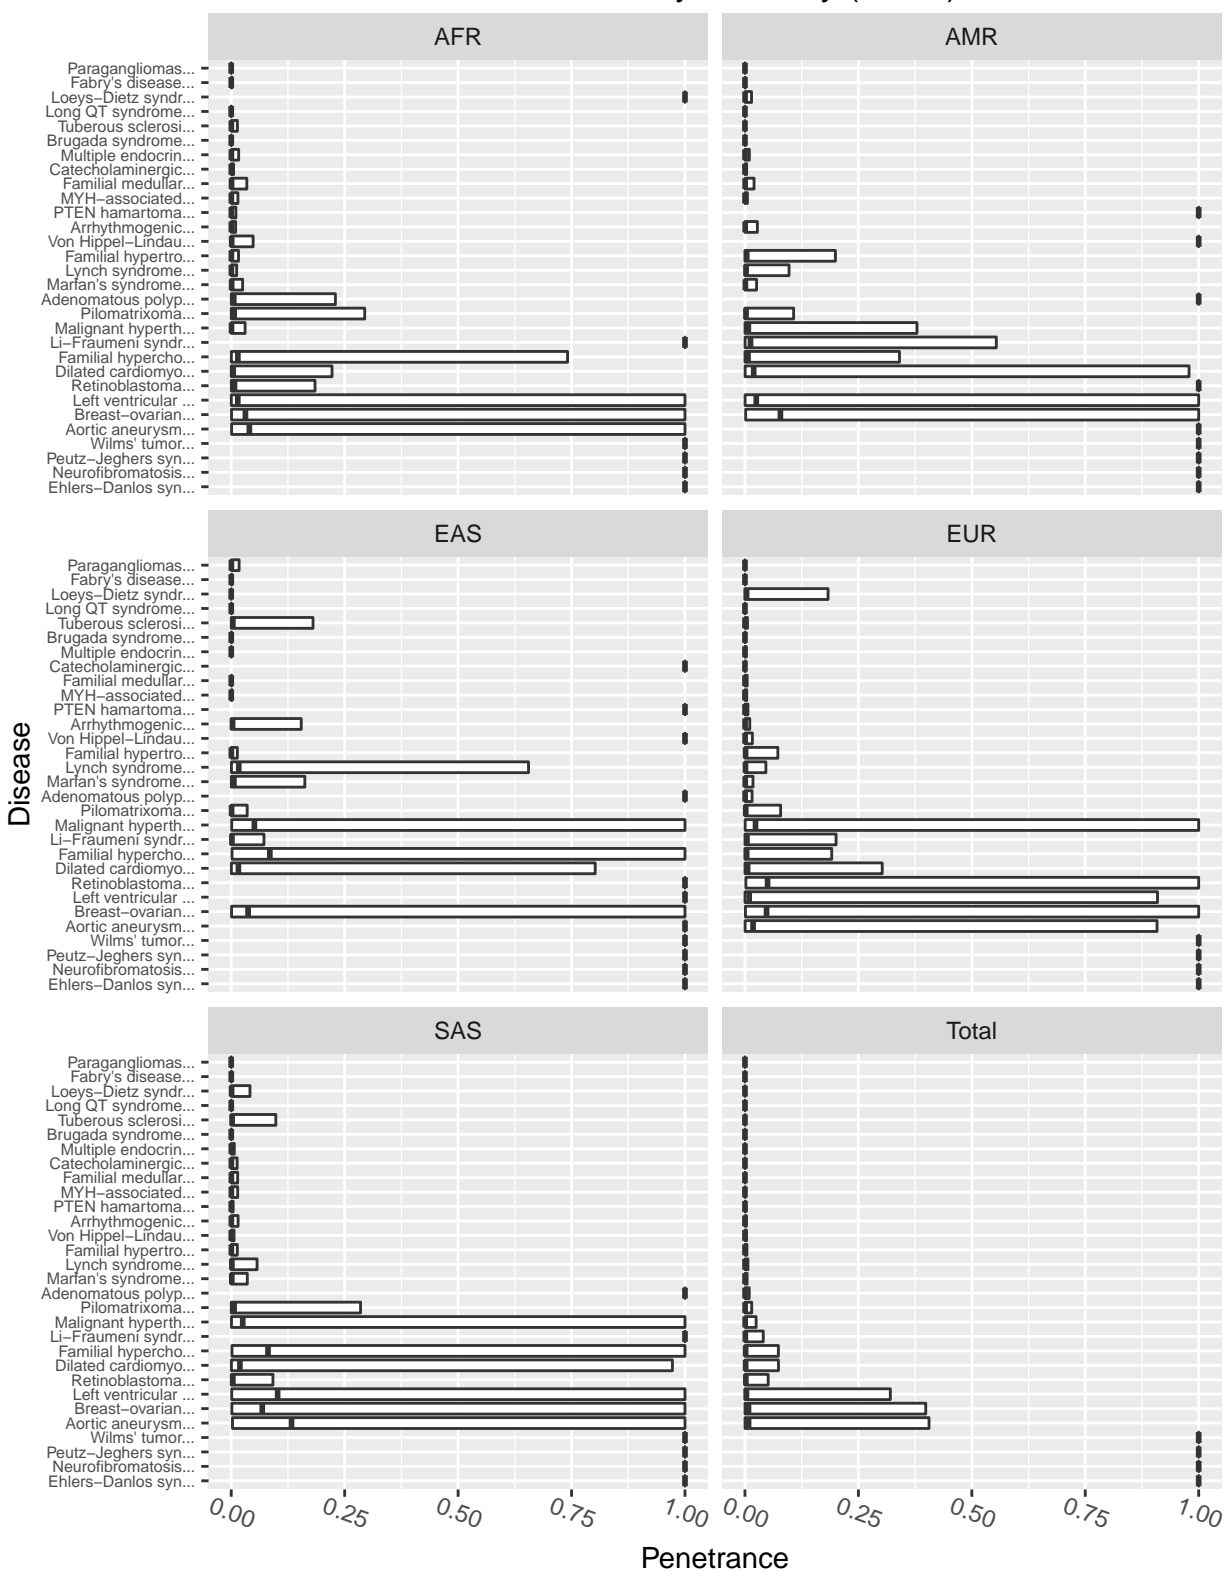

Note: Prevalence ranges of 5x were assumed for all point estimates of prevalence.
For example: a point estimate of 0.022 would be given the range 0.01-0.05.

3.2 Penetrance Estimates by Ancestry

Penetrance by Ancestry (ExAC)

3.3 Empirical CDFs for All Penetrance Plots

3.4 Comparing Mean Penetrance between ExAC and 1000 Genomes

The Pearson correlation is 0.93.

Max penetrance values computed using 1000 Genomes are 7.6-fold larger than those computed using ExAC.
