2 Summary Statistics

2.1 Fraction of Individuals with Pathogenic Non-Reference Sites

### 3 Penetrance Estimates

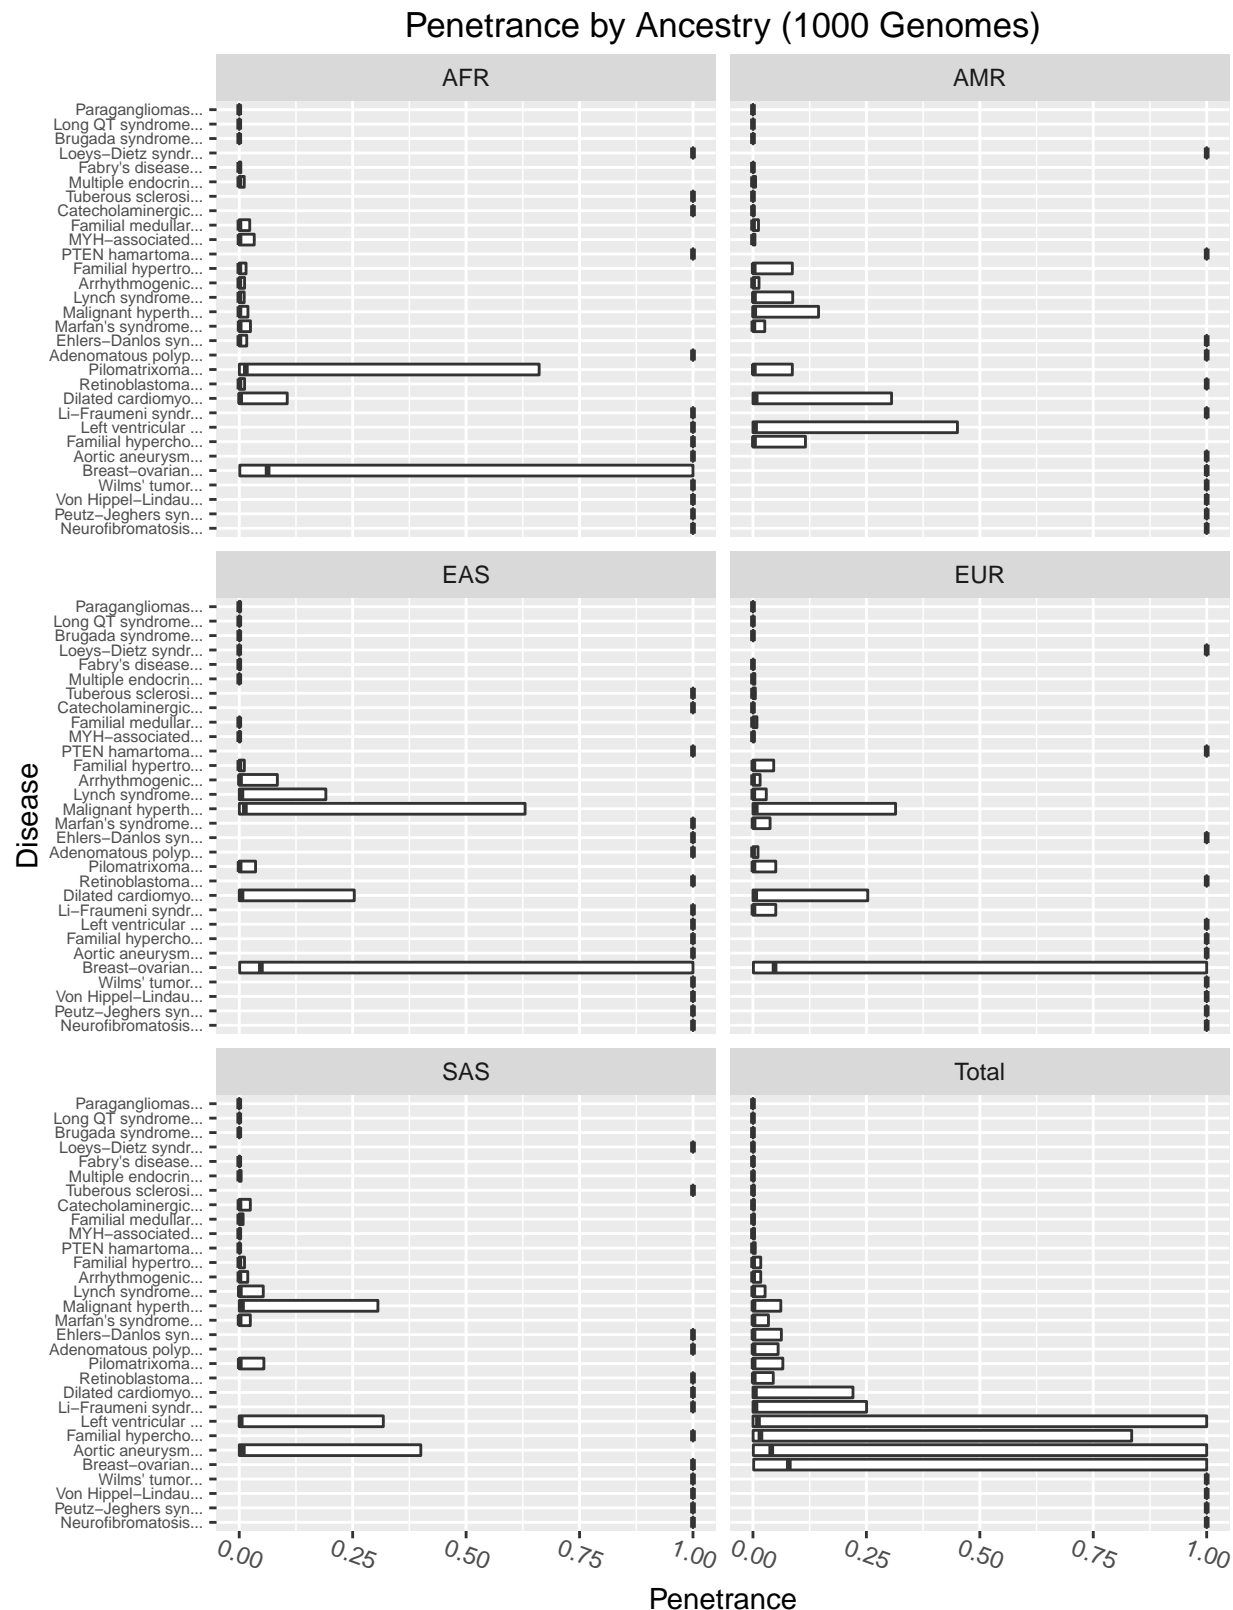

#### 3.1 Max/Min Penetrance as a Function of $P(D)$ and $P(V|D)$

The left end of the boxplot indicates  $P(D)$  AND  $P(V|D)$  = lower value,  
the bold line in the middle indicates  $P(D)$  AND  $P(V|D)$  = geometric\_mean(values),  
the right end of the boxplot indicates  $P(D)$  AND  $P(V|D)$  = upper value.

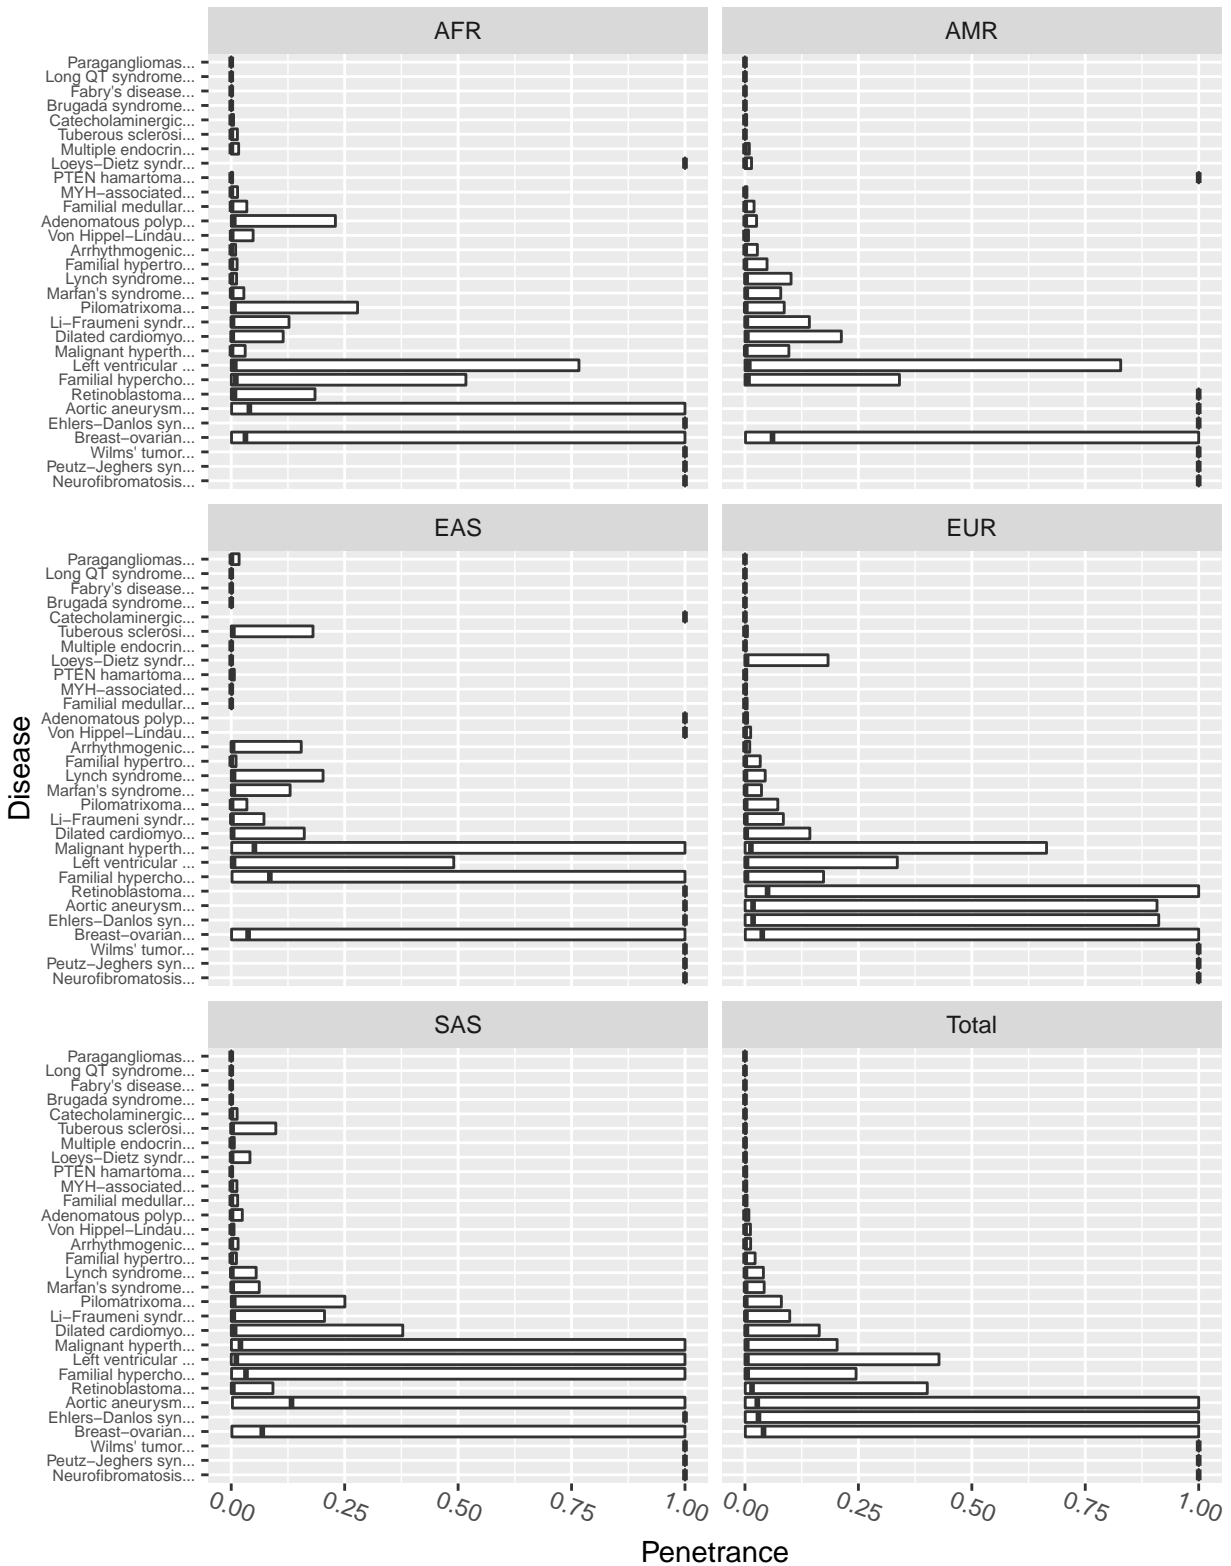

Note: Prevalence ranges of 5x were assumed for all point estimates of prevalence.  
For example: a point estimate of 0.022 would be given the range 0.01-0.05.

### 3.2 Penetrance Estimates by Ancestry

## Penetrance by Ancestry (ExAC)

### 3.3 Empirical CDFs for All Penetrance Plots

### 3.4 Comparing Mean Penetrance between ExAC and 1000 Genomes

The Pearson correlation is 0.8.

Max penetrance values computed using 1000 Genomes are 1.3-fold larger than those computed using ExAC.
